

PROJECTS SOLUTIONS

Client Requirements

Coordinate transportation of project cargo from the U.S., Europe and Asia to ten Former Soviet Union countries.

Solution

Lead a planning effort involving extensive corporate resources and personnel addressing all key operational and management requirements, ensuring the program's ongoing success and our ability to manage significant peaks in volume.

Results

We have consistently exceeded our client's key performance metrics while building a strong, 12-year partnership.

As projects specialists, Lynden Logistics offers comprehensive transportation and logistics engineering capabilities with worldwide coordination, including services like air and ocean consolidations and charters and part charters from anywhere, to anywhere. We are experts in engineering transportation solutions through a defined planning, execution, and management process that produces the most efficient worldwide shipping service possible. This expertise has proven invaluable to one of our project clients serving as the prime contractor for a major U.S. Department of Defense initiative.

The work we perform for this client is complex and involves several individual projects operating simultaneously and coordination with multiple Engineering, Procurement, and Construction (EPC) contractors. Lynden provides receiving and consolidation of materials for transportation of cargo to ten countries in the Former Soviet Union (FSU), with primary destinations in Russia, Georgia, and Ukraine. Shipments originate in the USA, Europe, and Asia as well as within, and/or between FSU countries. Our services include materials expediting, line-item receiving, bar-coding, staging, and export packing, delivery transport by rail, truck, air, and/or barge, preparation of all shipping documentation, and complete web visibility and shipment tracking.

To ensure successful execution of this project, Lynden initiated a comprehensive planning process that thoroughly addressed each individual project within the context of the entire program. We employed substantial corporate resources and key personnel at initial project planning to facilitate high operational conformance and successful installation of quality management processes. Key to this process was also establishing capacity buffers in systems, hardware, and personnel to handle peaks in business volume.

As their primary logistics contractor, Lynden Logistics consistently meets or exceeds our client's key performance metrics. This has resulted in a continuation of our companies' 12-year business relationship and additional opportunities to provide services outside the scope of this project.
